Introduction

Artificial Intelligence (AI) is a branch of computer science that enables machines to perform tasks that normally require human intelligence. A chatbot is an AI-based program that interacts with users by answering their questions. Chatbots are widely used in education, business, healthcare, and customer support.

This project develops a simple chatbot in Python that provides information about my father. The chatbot uses a dictionary to store information and responds according to the user's question.

Objectives

- To understand the basic concept of a chatbot.
- To implement a simple chatbot using Python.
- To use a dictionary for storing and retrieving information.
- To provide answers in an easy and interactive way.

Theory

A chatbot is a software application that communicates with users through text or voice. In this project, a rule-based chatbot is used. It checks the user's input and returns the corresponding information.

Python is a suitable language for chatbot development because it is easy to learn, readable, and provides powerful programming features.

The dictionary data structure stores information in the form of key-value pairs, making it simple to access the required data.

Information Used

Father Name: Adrees
Age: 62 Years
Work: Senior Khatib at Mudrisa Anwarul Alooom
Education: Hifzul Quran
Main Work Challenges:

- Training teachers and students to work hard.

- Visiting branches in other cities to conduct tests.

Python Code

```
print("==== Father Information Chatbot ====")
print("Type 'exit' to quit.\n")

father = {
    "name": "Adrees",
    "age": "62 years",
    "work": "Senior Khatib at Mudrisa Anwarul Alooom",
    "education": "Hifzul Quran",
    "problem": "Training teachers and students and visiting branches for tests"
}

while True:
    user = input("You: ").lower()

    if user == "exit":
        print("Bot: Thank you! Goodbye.")
        break
    elif "name" in user:
        print("Bot:", father["name"])
    elif "age" in user:
        print("Bot:", father["age"])
    elif "work" in user or "job" in user:
        print("Bot:", father["work"])
    elif "education" in user:
        print("Bot:", father["education"])
    elif "problem" in user or "challenge" in user:
        print("Bot:", father["problem"])
    else:
        print("Bot: Sorry, I don't have information about that.")
```

Sample Output

```
==== Father Information Chatbot ====
Type 'exit' to quit.
```

```
You: what is your father name?
Bot: Adrees
```

```
You: what is his age?
Bot: 62 years
```

```
You: what is his work?
Bot: Senior Khatib at Mudrisa Anwarul Alooom
```

```
You: what is his education?
Bot: Hifzul Quran
```

```
You: exit
Bot: Thank you! Goodbye.
```

Advantages

- Easy to understand.
- Uses Python dictionary for data storage.
- Interactive question-answer system.
- Simple and beginner-friendly.

Conclusion

This project demonstrates how a basic chatbot can be developed using Python. The chatbot stores information in a dictionary and provides answers based on user questions. It is a simple example of Artificial Intelligence concepts and can be extended by adding more questions and features in the future.
